

RAD (Rapid Application Development) is a software development methodology that emphasizes quick development and iteration of prototypes over strict planning and long development cycles. It's ideal for projects where requirements evolve through user feedback and where fast delivery is important.

Key Characteristics of RAD:

- Focus on prototypes instead of extensive documentation
- User involvement throughout the development process
- Fast development cycles with frequent iterations
- Reusable components to reduce effort
- Best suited for UI/UX-intensive projects like web and mobile apps

This is where the project goals, system requirements, and user needs are identified. Stakeholders, users, and designers collaborate to decide what needs to be built.

Requirements Planning

1) Identify Key Features

- **Navigation (Bottom Bar):**
 - Home
 - Search
 - Library
 - Premium
- **Music Discovery & Playback:**
 - Trending New Releases (Horizontal Scroll)
 - Curated Playlists
 - Categorized Genre Browsing (Pop, Rock, Jazz, etc.)
 - Persistent Mini-Player (Global across all screens)
- **User Actions:** Browsing, Searching, Filtering Library, Upgrading Subscription, Playing Music.

2) Create a Requirements Document:

1. View a customized greeting and personalized playlists on the dashboard.
2. Search for specific audio tracks and browse music by distinct genre categories.
3. Access and filter the user's personal library (Playlists, Artists, Albums, Downloaded).
4. Control audio playback continuously via a bottom mini-player.

5. View premium subscription features, pricing, and checkout options.

User Design

Designers and users collaborate to create wireframes and prototypes. The idea is to show how the application will look and behave before any actual coding starts.

1) Tools Used: * **Axure:** Used to design the wireframes and high-fidelity UI prototype.

2) Wireframes Designed:

- **Home Page:** Highlights a "Good afternoon" greeting, features "Trending New Releases" with cover art, and provides quick access to "Your Playlists" (e.g., Liked Songs, Discover Weekly).
- **Search Page:** Contains a primary text input field ("What do you want to listen to?") and a "Browse All" section featuring colorful, categorized cards for different music genres.
- **Library Page:** Shows saved items (Chill Vibes, Workout Mix) alongside horizontal filter chips allowing the user to sort by All, Playlists, Artists, Albums, or Downloaded content.
- **Premium Page:** Outlines subscription benefits (Ad-free listening, offline downloads, high-quality audio) with a clear call-to-action for the \$9.99/month Individual plan.
- **Global Elements:** A persistent dark-themed bottom navigation bar and an anchored mini-player displaying the active track ("Neon Dreams") with a play/pause toggle

Construction

This is where the actual development happens, but in RAD, it is tightly coupled with ongoing testing and feedback. You refine the prototype based on user responses.

1) Interactive Prototypes:

- Created using Axure's prototype linking features.
- **Functional paths designed:**
 - Bottom Navigation: Home → Search → Library → Premium
 - Playlist click → Opens specific playlist view
 - Search input → Triggers active search state

2) Dynamic Elements:

- Horizontal carousel scrolling for "Trending New Releases".
- Interactive filter chips in the Library tab.
- Simulated transitions for the play/pause button on the mini-player.

3) Testing and Iteration:

- Prototype previewed to assess visual hierarchy (dark mode contrast, vibrant accent colors).
- Collected feedback from stakeholders (assumed for documentation).
- Iterated based on visual hierarchy, accessibility, and flow suggestions.

Cutover

In this final phase, the system goes live. This includes finalizing the design, training users, and preparing documentation for developers.

1) Finalization and Export:

- Final design prototype published to Axure Cloud.
- Ready for hand-off to the development team.
- Assets (album art, iconography) prepared for export.

2) User Training & Support:

- Walkthrough of the prototype for stakeholders or development team.
- Notes/documentation provided for developers to understand functionality and user flow. (e.g., specifying that the mini-player must remain static while the main view above it scrolls).
